

SPIRE IT

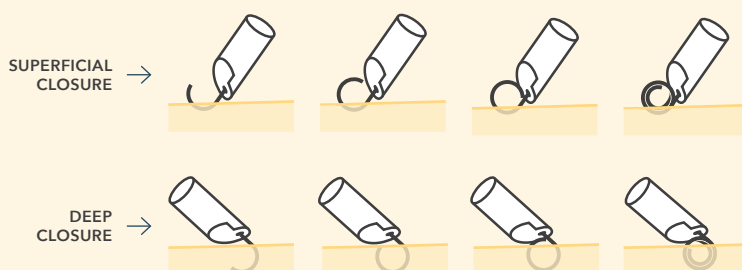

PATENTED TACKER

SPIRE'IT® is a permanent suture applier used in the fixation of implants or tissue closing. It is manufactured from the same shape memory alloy used in cardiac surgery (Nitinol). Ten sutures are stored horizontally in a barrel and return to their original teached spire shape once implanted in the body at 37°C.

The original patented technology allows the surgeon to modify the suture deepness by changing the applicator's incident angle.

The applicator is available in two sizes and shipped with 10 or 20 sutures:

- Short applicator (7cm) for open surgery
- Long applicator (30cm) for 5mm cœlioscopic surgery

⊕ BENEFITS

- Customized suture deepness from 0.1 to 4 mm
- No sharp edges for reducing tissues traumatism
