

SPIRE'IT

PATENTED APPLIER

SPIRE'IT® is a permanent suture applier used in the fixation of implants. It is manufactured from the same shape memory alloy used in cardiac surgery (Nitinol). Ten sutures are stored horizontally in a barrel and return to their original teached suture shape once implanted in the body at 37°C.

The original patented technology allows the surgeon to modify the suture deepness by changing the applier's incident angle.

The applier is available in two sizes and shipped with 10 or 20 sutures :

- Short applier (7cm) for open surgery
- Long applier (30cm) for 5mm coelioscopic surgery

⊕ BENEFITS

- Customized suture deepness from 0.1 to 4 mm
- No sharp edges for reducing tissues traumatism
